Tejas More

AI & Machine Learning Engineer | Software Developer — production LLM systems, evaluation pipelines, and full-stack delivery.

tejasmore464@gmail.com Website LinkedIn GitHub Mumbai, India

PROFESSIONAL SUMMARY

AI/ML focused software engineer automating complex workflows and building accountable AI systems for real-world challenges. Focused on systems that go beyond generating outputs to support decisions, verify evidence, and keep high-risk actions under human oversight. Built multi-tenant AI decision agents that weigh the cost of acting before they act, fraud-detection systems with a reproducible 1.355% false-positive rate, and regulatory RAG pipelines over 267 pages of RBI/SEBI rules, where 177 of 179 generated statements were verified against their source. Wrote 2,859 automated tests across three deployed systems, reflecting a focus on reliability and traceability.

SKILLS

Programming Languages :	Java, Python, JavaScript, SQL, TypeScript
AI/ML :	RAG, Embeddings, Gemini API, NLP, Sentence Transformers, LLM Applications, TensorFlow, scikit-learn
Core CS & Design :	Data Structures & Algorithms, Object-Oriented Programming (OOP), Low-Level Design (LLD)
Frameworks & Libraries :	FastAPI, Next.js, SQLAlchemy, React, Express
Databases :	PostgreSQL, MongoDB, MySQL, ChromaDB, pgvector
Tools & Platforms :	Docker, Git, GitHub Actions, Vercel, Render, Neon, OAuth 2.0, CI/CD

EDUCATIONS

TransStadia Institute | Mumbai — 2023 - 2026
B.Sc, Artificial Intelligence & Sports Analytics — *CGPA : 9.71*

Patkar College of Arts and Science — 2021 - 2023
Science (PCM + Electronics)

WORK EXPERIENCES

AI & ML Intern | Internship — Apr 2025 - May 2025
Elevate Labs — *Remote*

- Developed a music genre classification model using audio features extracted with Librosa and machine learning techniques.
- Preprocessed audio data, evaluated model performance, and worked with TensorFlow to train and improve the classification model.

Technologies / Skills Used : *Python, TensorFlow, Librosa, scikit-learn*

DevOps Intern | Internship — May 2025 - Jun 2025
Elevate Labs — *Remote*

- Used Docker and Git for containerization and version control while working on project-based tasks.
- Explored Jenkins for CI/CD workflows and VirtualBox for working with virtual machines, gaining familiarity with development and deployment tools.

Technologies / Skills Used : *Docker, CI/CD, Git, Jenkins*

Tech Volunteer — 2025 - 2025
IBM Think Event — *On-site • Mumbai*

- Supported IBM Think at Jio World Convention Centre as a Tech Volunteer, assisting with a two-day B2B technology event showcasing IBM's enterprise solutions.
- Briefed on IBM products and communicated their key features to visiting executives, including senior business and technology leaders.

PROJECTS

Aether - Adaptive AI Monitoring and Decision System | Website Case Study — Nov 2025 - Present
Individual Project

- Built and deployed a multi-tenant AI monitoring platform, providing each SME tenant with an isolated agent across five business domains; **1,388 automated tests**, zero skips, gated in CI.
- Developed the RAG layer on PostgreSQL + pgvector with locally computed Sentence-Transformers embeddings, achieving vector and keyword agreement before quoting past decisions (**retrieval improved from 0.22 to 0.56**).
- Engineered an economics-gated decision engine—code decides, Gemini only explains—pricing a **$9,194.51** overdue book at **$3.78/day** against **$400** to act, with high-risk actions awaiting human approval.
- Enforced tenant isolation using PostgreSQL row-level security and a non-owner app role (12 of 25 tables), validated in CI; integrated Xero via OAuth 2.0 + PKCE with encrypted refresh-token rotation.
- Shipped solo on **3 FastAPI services**, **2 Next.js/TypeScript apps**, Neon Postgres, and Docker, utilizing GitHub Actions CI, **AES-256 backups** proven by restore, and a measured **2m11s rollback**.

Technologies / Tools Used : *Python, FastAPI, PostgreSQL, SQLAlchemy, Next.js, pytest, Docker, OAuth 2.0, TypeScript, Gemini API, CI/CD, RAG, Sentence-Transformers, LiteLLM*

PROJECTS

DarkHorse AI - Anti-Fraud Detection Platform | Website Case Study Mar 2026 - Present
Individual Project

- Built and shipped a live multi-tenant anti-fraud platform for small finance teams, detecting invoice fraud, CEO fraud, and phishing with severity verdicts, verbatim evidence, and irreversible-first actions; **1,246 tests** (1,135 Python engine + 111 web app), CI-gated on a false-positive budget.
- Engineered a six-signal detection pipeline—sender authentication, domain age, lookalike domains, link reputation, attachment analysis, and LLM persuasion analysis (Gemini)—over text, URLs, `.eml`, screenshots (OCR + QR), and voice notes, fused into one honest verdict.
- Eliminated LLM-fabricated evidence with a span-verification guard that discards any quote not found verbatim in the source; **2 of 8 action-quotes rejected** across **399 real messages**; every signal reports UNAVAILABLE, never 0, so a skipped check never reads as a pass.
- Published a reproducible **1.355% false-positive rate** (9 of 664) at **11.1% recall** on a fingerprinted, frozen **718-message held-out set**, regenerated by a single command; withdrew an earlier **0.55% figure** that did not reproduce.
- Enforced tenant isolation in PostgreSQL row-level security, forced across **13 of 17 tables** and three database roles, and shipped the production stack - Docker, Alembic, argon2 auth, hash-chained audit trail, rate limiting, GDPR-shaped erasure across Vercel and Render

Technologies / Tools Used : *Python, PostgreSQL, SQLAlchemy, Next.js, Docker, pytest, TypeScript, Alembic, Tesseract OCR, Gemini API, FastAPI, GitHub Actions, CI/CD*

Fintrust - Regulatory Intelligence for Indian Finance | Website Case Study Apr 2026 - Present
Individual Project

- Built and deployed an **LLM-powered compliance platform** that explains **7 RBI/SEBI regulations** (267 pages) in plain language for advisers and NBFCs, with cited Q&A, obligation tracking, and deadlines.
- Engineered a **hallucination guard**: every LLM statement must quote the regulator, and code verifies the quote in the source before showing it (**177 of 179 statements verified, 98.9%**).
- Designed **hybrid RAG retrieval** in a single PostgreSQL query (pgvector + full-text search, Reciprocal Rank Fusion) with a calibrated relevance gate that abstains instead of guessing; **2–5 seconds** for answers.
- Built an idempotent **7-stage ingestion pipeline** with Gemini structured extraction: **82 verified obligations** turned into **132 deadlines** by deterministic code, plus weekly change digests.
- Shipped on **Next.js** (Vercel), **FastAPI** (Render), and **Neon Postgres** with **225 automated tests** and GitHub Actions CI; fixed a connection-pool deadlock and race-prone rate limits.

Technologies / Tools Used : *Python, FastAPI, PostgreSQL, Next.js, Gemini API, RAG, pytest, TypeScript, Playwright, pgvector, GitHub Actions*
