Tejas More

Software engineer specializing in AI systems, LLM applications, and scalable full-stack development.

tejasmore464@gmail.com Website LinkedIn GitHub Goregaon East, Mumbai, India

PROFESSIONAL SUMMARY

AI/ML focused software engineer building and deploying production-grade AI systems and LLM applications end-to-end. Experienced in Python, FastAPI, PostgreSQL, RAG, embeddings, and modern full-stack development, with a focus on reliable, secure, and measurable AI products. Built multi-tenant systems with database-level isolation, evaluation pipelines, automated testing, and cloud deployments across Vercel, Render, and managed PostgreSQL. Strong foundation in software engineering, data structures, and machine learning, with hands-on experience taking AI products from architecture to production.

SKILLS

Programming Languages :	Java, Python, JavaScript, SQL, TypeScript
AI/ML :	RAG, Embeddings, pgvector, Gemini API, NLP, Sentence Transformers, LLM Applications
Frameworks & Libraries :	FastAPI, Next.js, SQLAlchemy, React, Express
Databases :	PostgreSQL, MongoDB, MySQL, ChromaDB
Tools & Platforms :	Docker, Git, GitHub Actions, GitHub, Vercel, Render, Neon, OAuth 2.0
Soft Skills :	Communication, Problem Solving, Critical Thinking, Decision Making

PROJECTS

Aether - Self-Evolving Autonomous AI System | Website Github — Nov 2025 - Present

Individual Project

- Built a multi-tenant SME monitoring platform across five domains (receivables, cash runway, payables, inventory, customer risk) with high-risk actions held for human approval; **1,354 backend + 34 front-end/browser tests**, zero skips, **five CI gates**.
- Enforced tenant isolation with PostgreSQL RLS and a non-owner app role, proven against a real Postgres in CI, including concurrent tenants on a shared pool and a vector query whose nearest neighbour belongs to another tenant.
- Engineered an economics-gated decision engine with per-tenant adaptive calibration, which priced a **$9,194.51** overdue book at **$3.78/day** against a **$400** cost to act and declined, unprompted.
- Integrated Xero via OAuth 2.0 + PKCE with encrypted refresh-token rotation and SSRF-guarded connectors; its first live run exposed **4 defects** invisible to **27 passing tests**, and **ar_total 9,194.51** with overdue ratio **0.7555** then matched the live dashboard exactly.
- Replaced example-based tests with property assertions, catching a production bug in one second: a required metric the payables integration never emitted, silently quarantining every reading.
- Built an RLS-protected RAG knowledge base (pgvector, Sentence-Transformers) needing **two independent signals** before quoting past decisions (cross-action quoting **0.22 → 0.56**), plus break-glass staff access mirrored into the customer's own audit log.
- Shipped the free-tier stack: **3 FastAPI services** (Render), **2 Next.js apps** (Vercel), Neon Postgres + pgvector, **3 GitHub Actions jobs**, **AES-256 daily backups** proven by decrypt-and-restore.
- Proved operations by measurement: **2m11s rollback** across three services both ways; **10 defects** found only by running the system, three on the public page, caught by a real-browser check.

Technologies / Tools Used : *Python, FastAPI, PostgreSQL, SQLAlchemy, Next.js, pytest, Docker, Gemini, OAuth 2.0, TypeScript*

DarkHorse AI - Anti-Fraud Detection Platform | Website Github — Mar 2026 - Present

Individual Project

- Built and shipped a live multi-tenant anti-fraud product for small finance teams, addressing **invoice fraud, CEO fraud, and phishing** with severity verdicts, verbatim evidence per finding, and ordered actions starting with irreversible ones.
- Engineered a six-signal pipeline over text, URLs, `.eml`, screenshots (OCR + QR), and voice notes (speech-to-text) into one calibrated verdict; conducted **1,124 tests**, CI-gated on a false-positive budget.
- Enforced tenant isolation with **PostgreSQL RLS** across three roles, ensuring one tenant reads zero rows of another.
- Eliminated LLM-fabricated evidence by span-verifying every quotation; unverifiable findings are discarded, not scored; guard cost: **2 of 8 action-quotes rejected** across **399 real messages**.
- Published a reproducible **1.355% false-positive rate** (9 of 664) on a frozen, deduplicated held-out set; withdrew an earlier figure that didn't reproduce.
- Every signal reports **UNAVAILABLE**, not zero, when a check can't run, ensuring skipped checks never read as passed; degradations exposed via `/health`.
- Shipped the full production stack: **Docker** (OCR/QR deps), Alembic, hash-chained audit trail, rate limiting, GDPR-shaped account erasure, and same-origin proxy for first-party cookies across Vercel and Render.

Technologies / Tools Used : *FastAPI, Python, PostgreSQL, SQLAlchemy, Next.js, Docker, pytest, Claude, TypeScript, Alembic, Tesseract OCR*

Fintrust - Regulatory Intelligence for Indian Finance | Website Github — Apr 2026 - Present

Individual Project

- Built and deployed a citation-grounded regulatory-intelligence product for SEBI advisers and NBFC compliance teams, explaining **7 RBI/SEBI circulars and directions (267 pages)**, answering questions across them and tracking deadlines, with every statement backed by a verbatim quote; **223 tests** against a real Postgres, CI-gated.
- Made citations a database guarantee: every claim carries a verbatim quote and character span on immutable version text, and unverifiable claims are withheld (**177 of 179 statements verified, 98.9%**). A relevance gate calibrated on **15 hand-written questions** replies "the documents don't say" without calling the model.
- Built hybrid retrieval in a single Postgres database (pgvector HNSW + full-text search, fused by Reciprocal Rank Fusion, filtered by entity type); investment-advice questions are declined twice, by a pattern check before retrieval and by the model's own flag.
- Extracted obligations as structured, cited records (**82 of 90 kept**; code checks each deadline appears in its quote), feeding a deterministic (non-LLM) deadline generator (**132 dated deadlines**), weekly change digests and old-to-new provision mapping, via idempotent **7-stage ingestion**.
- Shipped the full stack (Next.js/Vercel, FastAPI/Render, Neon, Alembic, GitHub Actions); a security review fixed an unauthenticated pool-deadlock DoS and race-prone rate limits; every page passes WCAG 2.1 AA; every AI call is logged with model, prompt version, tokens and latency.

Technologies / Tools Used : *Python, FastAPI, PostgreSQL, Next.js, Gemini API, RAG, pytest, TypeScript, Playwright, pgvector*

CERTIFICATIONS

Machine Learning Specialization | Certificate
DeepLearning.AI

Object Oriented Programming | Certificate
TakeUForward - Striver

Data Structures and Algorithm | Certificate
Apna College

WORK EXPERIENCES

Tech Volunteer 2024 - 2025
IBM Flagship Event "Think" *Mumbai*

AI & ML Internship | DevOps Internship | Internship 2025 - 2025
Elevate Labs *Remote*

EDUCATIONS

TransStadia Institute | Mumbai 2023 - 2026
B.Sc, Artificial Intelligence & Sports Analytics *CGPA : 9.71*

Patkar College of Arts and Science 2021 - 2023
Science (PCM + Electronics)

Lakshdham High School – Goenka 2009 - 2021
High School, ICSE Board
